MCDB/BCHM 4312/5312
Fall 2020

Announcement

- Q1 of PS4 will be covered next week

Homework feedback

- Mean/std instead of by rows
- Try not to use for loops

How digital images are recorded

Image is projected onto camera sensor

Scientific-grade digital cameras

Question

- For an image to be projected onto the camera sensor, it must be _____
 - A. Real
 - B. Imaginary

A real image is projected onto camera sensor

The sensor measures light falling on each pixel

Sample

Projected onto camera sensor

Sensor measures intensity of pixels

Image

What is the effective pixel size or image resolution?

- A. The number of pixels illuminated by light
- B. The size of the pixel of the camera
- C. The number of pixels in an image
- D. The region of the sample that is imaged onto a single camera pixel

The sensor measures light falling on each pixel

Sample

Projected onto camera sensor

Sensor measures intensity of pixels

Image

Image **resolution** or **effective pixel size** = Area of sample projected on to a pixel
Usually reported in units of $\mu\text{m}/\text{px}$
Calibrated by microscope company

Which factors affect the effective pixel size?

- A. Number of camera pixels
- B. Size of the sample
- C. Magnification of the objective
- D. Physical size of the camera pixels

Analog intensity is converted to digital gray levels

Number of steps = bit depth

Each gray level represents a range of intensities

Units of gray level (intensity) = Counts/ A.U./ I.U.

Image data is stored as an array of numbers

Image

Data

3	40	20	3	3	3	3	3
83	26	3	70	40	3	3	3
50	3	3	66	63	79	3	3
3	3	248	99	23	36	3	3
83	3	36	66	179	255	3	3
3	3	56	162	123	89	3	3
182	3	36	73	3	3	3	3
99	3	26	3	3	3	3	3

What data type is used to store image data?

- A. Signed integers
- B. Character arrays
- C. Unsigned integers
- D. Double-precision floating-point format
- E. What are data types?

Digital data is stored as bits

- A bit can only have one of two values

true
1

false
0

- How can we store different types of information (e.g. numbers and text) using just bits?

Data type or class in MATLAB

Unsigned integer

4-bit unsigned integer

x	x	x	x					
2^3	2^2	2^1	2^0					
↓	↓	↓	↓					
8	+	0	+	0	+	1	=	9

The position of the bit indicates its value as a power of 2

Bit depth is the number of bits used to digitize the intensity

2 bit

4 bit

8 bit

16 bit

Bit depth

2 bit

4 bit

8 bit

16 bit

Glossary of terms

- **Pixel:** Sampled data point, element in matrix
- **Pixel value/intensity:** Numerical value of a pixel in image
- **Physical pixel size/effective pixel size/image resolution:** the region of the original sample projected on a pixel
- **Bit depth:** Number of bits used to quantize the intensity

Grayscale

Matrix size 100x100
Data type uint16

Color (RGB)

100x100x3
uint16

Logical

100x100
logical

Key functions

- `imread`
- `imshow`
- `imwrite`

Common file formats

- JPG , JPEG – Often used in digital cameras, web images
- GIF – Often used for animated web images
- PNG – Now often used in web images
- TIFF, TIF – Often used for scientific imaging, must be saved uncompressed

Image compression is used to reduce file size

Original
Uncompressed TIFF
336 kB

50%
JPEG compression
12.6 kB

90%
JPEG compression
9.02 kB

```
I = imread('filename')
```

reads image data into matrix I

AT3_1m4_01.tif

imshow(I)

displays image in matrix I

Which of the following statements correspond to the pixel with the (x, y) coordinates shown above?

A. $I(182, 337)$

B. $I(337, 182)$

Which of the following statements correspond to the pixel with the (x, y) coordinates shown above?

A. $I(182, 337)$

B. $I(337, 182)$

Changing how bright images appear

```
>> I = imread('mri.tif');  
>> imshow(I)
```

Image looks dark... why?

What is the highest pixel value in the image?

The colorbar

```
>> colorbar
```

Shows how pixel values are mapped to color

Important to show when displaying quantitative data

imshow scales displayed colors depending on data type

- For unsigned integer

0 to maximum value of integer
(e.g. 8-bit image: 0 and 255)

- For double

0 to 1

- For logical

0 and 1

Default scaling using imshow

Changing the displayed color scale

```
imshow(image, [low, high])
```

```
>> imshow(I, [0, 88])
```

```
>> colorbar
```

Original intensity values
have not been changed

Automatic display scaling

```
imshow(I, [])
```

is equivalent to

```
imshow(I, [min(I(:)), max(I(:))])
```

- Download image demo16bit.tiff
- Convert to jpeg and save as uncompressed tiff
- Explain differences
